# ABOUT US

## ABOUT US

### WE HAVE THREE TYPE BOTTLES

#### 1. STEEL BOTTLES

The plastics in recyclable plastic water bottles are thought to be a health risk. Harmful chemicals are emitted from these bottles, and these chemicals might cause cancer. By switching to stainless steel, you can prevent harmful carcinogens from leaching into your drinking water. Hip flasks are thin flasks usually used for holding liquors. They are small flasks which make them convenient to carry anywhere you go. These flasks are mostly made of stainless steel. There are no known safety concerns associated with using stainless steel, assuming it is indeed stainless and lead-free. Compared to water in glass bottles, some people think stainless steel bottles make your water have a metallic taste and some can heat up in summer temperatures.
